1 Introduction

2 Source Terms and Boundary Conditions

To examine the weak turbulence that leads to instability, we consider a massive scalar field coupled to a spherically symmetry, asymptotically AdS_{d+1} spacetime in global coordinates whose metric is given by

$$ds^2 = \frac{L^2}{\cos(x)} \left(-A(t,x)e^{-2\delta(t,x)}\,dt^2 + A^{-1}(t,x)\,dx^2 + \sin^2(x)\,d\Omega_{d-1}^2 \right), \qquad (2.1)$$

where L is the AdS curvature (hereafter set to 1), and the radial coordinate $x \in [0, \pi/2)$. The dynamics of the system come from the Einstein and Klein-Gordon equations:

$$G_{\mu\nu} + \Lambda g_{\mu\nu} = 8\pi \left(\nabla_\mu \phi \nabla_\nu \phi - \frac{1}{2} g_{\mu\nu} \left(\nabla^\rho \phi \nabla_\rho \phi + m^2 \phi^2 \right) \right), \quad \text{and} \quad \nabla^2 \phi - m^2 \phi = 0, \quad (2.2)$$

with Λ as cosmological constant for AdS, $\Lambda = -d(d-1)/2$.

Perturbing around static AdS, we expand the minimally-coupled scalar field in terms of odd powers of epsilon (the even powers do not contribute)

$$\phi(t,x) = \epsilon \phi_1 + \epsilon^3 \phi_3 + \dots \qquad (2.3)$$

and the metric functions A and δ in terms of even powers of the expansion parameter,

$$A(t,x) = 1 + A_2 \epsilon^2 + \dots \quad \text{and} \quad \delta(t,x) = \epsilon^2 \delta_2 + \dots. \qquad (2.4)$$

We choose to work in the boundary gauge, where $\delta(t, \pi/2) = 0$, for reasons that we discuss below.

At linear order, ϕ_1 satisfies

$$\partial_t^2 \phi_1 + \hat{L}\phi_1 = 0 \quad \text{where} \quad \hat{L} \equiv \frac{1}{\mu}(\mu' \partial_x + \mu \partial_x^2) - \frac{m^2}{\cos^2(x)}, \qquad (2.5)$$

where $\mu \equiv \tan^{d-1}(x)$. Writing the scalar field as the product of time- and position-dependent parts,

$$\phi_1(t,x) = \sum_j c_j(t) e_j(x), \qquad (2.6)$$

we find that the basis functions $e_j(x)$ are the solutions to the eigenvalue equation

$$\hat{L} e_j(x) = \omega_j^2 e_j(x). \qquad (2.7)$$

The general solution to this eigenvalue equation involves two types of functions: those that are normalizable and therefore vanish as $x \to \pi/2$, and those that are non-normalizable and approach a finite value on the boundary. In many previous works, the dynamics of scalar fields

have been studied using exclusively normalizable functions (as is the focus of §3); however, we now wish to consider so-called "pumped" systems, where a time-dependent source term exists on the boundary that sends energy into AdS. This energy is carried into the bulk spacetime via non-normalizable solutions to (2.7), and coupling between the scalar field and metric functions drives the system out of equilibrium.

In general, a combination of normalizable and non-normalizable eigenmodes make up the scalar field:

$$\phi_1(t,x) = \sum_j c_j(t)e_j(x) + \sum_\alpha A_\alpha(t)E_\alpha(x)\,, \tag{2.8}$$

with the A_α set by the choice of boundary conditions. The normalizable modes have eigenfunctions given by

$$e_j(x) = k_j \left(\cos(x)\right)^{\Delta^+} P_j^{(d/2-1,\,\Delta^+ - d/2)} \left(\cos(2x)\right) \tag{2.9}$$

$$k_j = 2\sqrt{\frac{(j+\Delta^+/2)\Gamma(j+1)\Gamma(j+\Delta^+)}{\Gamma(j+d/2)\Gamma(j+\Delta^+-d/2+1)}}\,, \tag{2.10}$$

with fully resonance eigenvalues $\omega_j = 2j + \Delta^+$, $j \in \mathbb{Z}^*$, and Δ^+ as the positive root of $\Delta(\Delta-d) = m^2$. On the other hand, non-normalizable eigenfunctions with arbitrary frequency ω_α, have basis functions

$$E_\alpha(x) = (\cos(x))^{\Delta_+} \, {}_2F_1\left(\frac{\Delta_+ + \omega_\alpha}{2}, \frac{\Delta_+ - \omega_\alpha}{2}, d/2; \sin^2(x)\right)\,. \tag{2.11}$$

DISCUSS RESONANT CONTRIBUTIONS & THE TIME AVERAGING PROCEDURE

Without specifying whether an eigenmode is non-/normalizable, we can determine the effect of the weakly turbulent transfer of energy at $\mathcal{O}(\epsilon^3)$, with

$$\ddot{\phi}_3 + \hat{L}\phi_3 = S = 2(A_2 - \delta_2)\ddot{\phi}_1 + (\dot{A}_2 - \dot{\delta}_2)\dot{\phi}_1 + (A_2' - \delta_2')\phi_1' + m^2 A_2\phi_1 \sec^2 x\,. \tag{2.12}$$

Following the steps outlined in Appendix A, and employing the solution $c_i(t) = a_i\cos(\omega_i t + b_i) = a_i\cos\theta_i$,

the source term can be written as

$$
\begin{aligned}
S_\ell = {} & \frac{1}{4} \sum_{\substack{i,j,k \\ k \neq \ell}}^{\infty} \frac{a_i a_j a_k \omega_k}{\omega_\ell^2 - \omega_k^2} \Big[Z_{ijk\ell}^-(\omega_i + \omega_j - 2\omega_k) \cos(\theta_i + \theta_j - \theta_k) - Z_{ijk\ell}^-(\omega_i + \omega_j + 2\omega_k) \cos(\theta_i + \theta_j + \theta_k) - \\
& + Z_{ijk\ell}^+(\omega_i - \omega_j + 2\omega_k) \cos(\theta_i - \theta_j + \theta_k) - Z_{ijk\ell}^+(\omega_i - \omega_j - 2\omega_k) \cos(\theta_i - \theta_j - \theta_k) \Big] \\
& + \frac{1}{2} \sum_{\substack{i,j,k \\ i \neq j}}^{\infty} a_i a_j a_k \omega_j \left(H_{ijk\ell} + m^2 V_{jki\ell} - 2\omega_k^2 X_{ijk\ell} \right) \Big[\frac{1}{\omega_i - \omega_j} \left(\cos(\theta_i - \theta_j - \theta_k) + \cos(\theta_i - \theta_j + \theta_k) \right) \\
& - \frac{1}{\omega_i + \omega_j} \left(\cos(\theta_i + \theta_j - \theta_k) + \cos(\theta_i + \theta_j + \theta_k) \right) \Big] \\
& - \frac{1}{4} \sum_{i,j,k}^{\infty} a_i a_j a_k \Big[\left(2\omega_j \omega_k X_{ijk\ell} + m^2 V_{ijk\ell} \right) \cos(\theta_i + \theta_j - \theta_k) - \left(2\omega_j \omega_k X_{ijk\ell} - m^2 V_{ijk\ell} \right) \cos(\theta_i - \theta_j - \theta_k) \\
& + \left(2\omega_j \omega_k X_{ijk\ell} + m^2 V_{ijk\ell} \right) \cos(\theta_i - \theta_j + \theta_k) - \left(2\omega_j \omega_k X_{ijk\ell} - m^2 V_{ijk\ell} \right) \cos(\theta_i + \theta_j + \theta_k) \Big] \\
& + \frac{1}{4} \sum_{i,j}^{\infty} a_i a_j a_\ell \omega_\ell \Big[\tilde{Z}_{ij\ell}^-(\omega_i + \omega_j - 2\omega_\ell) \cos(\theta_i + \theta_j - \theta_\ell) - \tilde{Z}_{ij\ell}^-(\omega_i + \omega_j + 2\omega_\ell) \cos(\theta_i + \theta_j + \theta_\ell) \\
& + \tilde{Z}_{ij\ell}^+(\omega_i - \omega_j + 2\omega_\ell) \cos(\theta_i - \theta_j + \theta_\ell) - \tilde{Z}_{ij\ell}^+(\omega_i - \omega_j - 2\omega_\ell) \cos(\theta_i - \theta_j - \theta_\ell) \Big] \\
& - \frac{1}{4} \sum_{i,j}^{\infty} a_i^2 a_j \left(H_{iij\ell} + m^2 V_{jii\ell} - 2\omega_j^2 X_{iij\ell} \right) \left[\cos(2\theta_i - \theta_j) + \cos(2\theta_i + \theta_j) \right] \\
& - \frac{1}{2} \sum_{i,j}^{\infty} a_i^2 a_j \left(H_{iij\ell} + m^2 V_{jii\ell} - 2\omega_j^2 X_{iij\ell} + 4\omega_i^2 \omega_j^2 P_{j\ell i} + 2\omega_i^2 (M_{j\ell i} + m^2 Q_{j\ell i}) \right) \cos\theta_j. \quad (2.13)
\end{aligned}
$$

As an exercise, we first derive the resonant contributions when the boundary source is zero, and therefore only normalizable modes are present. These results agree numerically with previous work on normalizable modes for massless scalars in the interior time gauge $\delta(t,0) = 0$. The definitions of the integral functions Z, H, X, etc. differ slightly from other works – in part because of the gauge choice, and in part because of a desire to separate mass-dependent terms – and so are given explicitly in Appendix A.

3 Resonances From Normalizable Solutions

Consider the case where each of the basis functions are given by normalizable solutions. After time-averaging, the resonant contributions occur for the following combination of normalizable frequencies:

$$
\omega_i \pm \omega_j \pm \omega_k = \pm \omega_\ell \quad (3.1)
$$

which can be separated into the three distinct cases

$$\omega_i + \omega_j + \omega_k = \omega_\ell \qquad (+++) \tag{3.2}$$

$$\omega_i - \omega_j - \omega_k = \omega_\ell \qquad (+--) \tag{3.3}$$

$$\omega_i + \omega_j - \omega_k = \omega_\ell \qquad (++-). \tag{3.4}$$

We will see that the first two resonances, $(+++)$ and $(+--)$, will non-trivially vanish whenever their respective resonance conditions are satisfied. This is in agreement with the results shown for the massless scalar in the interior time gauge (as they must be, since the choice of time gauge should not change the existence of resonant channels). Here we include the expressions for the naturally vanishing resonances, choosing to explicitly express the mass dependence.

3.1 Naturally Vanishing Resonances: $(+++)$ and $(+--)$

Resonant contributions that come from the condition $\omega_i + \omega_j + \omega_k = \omega_\ell$ are of the form

$$S_\ell = \underbrace{\sum_{i=0}^{\infty}\sum_{j=0}^{\infty}\sum_{k=0}^{\infty}}_{\omega_i+\omega_j+\omega_k=\omega_\ell} \Omega_{ijk\ell}\, a_i a_j a_k \cos\left(\theta_i + \theta_j + \theta_k\right) + \dots\,, \tag{3.5}$$

where dots denote other resonances, both vanishing and non-vanishing. $\Omega_{ijk\ell}$ is then given by

$$\Omega_{ijk\ell} = -\frac{1}{12}H_{ijk\ell}\frac{\omega_j(\omega_i+\omega_k+2\omega_j)}{(\omega_i+\omega_j)(\omega_j+\omega_k)} - \frac{1}{12}H_{ikj\ell}\frac{\omega_k(\omega_i+\omega_j+2\omega_k)}{(\omega_i+\omega_k)(\omega_j+\omega_k)} - \frac{1}{12}H_{jik\ell}\frac{\omega_i(\omega_j+\omega_k+2\omega_i)}{(\omega_i+\omega_j)(\omega_i+\omega_k)}$$
$$- \frac{m^2}{12}V_{ijk\ell}\left(1 + \frac{\omega_j}{\omega_j+\omega_k} + \frac{\omega_i}{\omega_i+\omega_k}\right) - \frac{m^2}{12}V_{jki\ell}\left(1 + \frac{\omega_j}{\omega_i+\omega_j} + \frac{\omega_k}{\omega_i+\omega_k}\right)$$
$$- \frac{m^2}{12}V_{kij\ell}\left(1 + \frac{\omega_i}{\omega_i+\omega_j} + \frac{\omega_k}{\omega_j+\omega_k}\right) + \frac{1}{6}\omega_j\omega_k X_{ijk\ell}\left(1 + \frac{\omega_j}{\omega_i+\omega_k} + \frac{\omega_k}{\omega_i+\omega_j}\right)$$
$$+ \frac{1}{6}\omega_i\omega_k X_{jki\ell}\left(1 + \frac{\omega_i}{\omega_j+\omega_k} + \frac{\omega_k}{\omega_i+\omega_j}\right) + \frac{1}{6}\omega_i\omega_j X_{kij\ell}\left(1 + \frac{\omega_i}{\omega_j+\omega_k} + \frac{\omega_j}{\omega_i+\omega_k}\right)$$
$$- \frac{1}{12}Z^-_{ijk\ell}\left(\frac{\omega_k}{\omega_i+\omega_j}\right) - \frac{1}{12}Z^-_{ikj\ell}\left(\frac{\omega_j}{\omega_i+\omega_k}\right) - \frac{1}{12}Z^-_{jki\ell}\left(\frac{\omega_i}{\omega_j+\omega_k}\right). \tag{3.6}$$

The second naturally vanishing resonance comes from the condition $\omega_i - \omega_j - \omega_k = \omega_\ell$, and is of the form

$$S_\ell = \sum_{j=0}^{\infty}\sum_{k=0}^{\infty}\Gamma_{(j+k+\ell+\Delta^+)jk\ell}\, a_j a_k a_{(j+k+\ell+\Delta^+)} \cos\left(\theta_{(j+k+\ell+\Delta^+)} - \theta_j - \theta_k\right) + \dots\,, \tag{3.7}$$

where

$$\Gamma_{ijk\ell} = \frac{1}{4}H_{ijk\ell}\frac{\omega_j(\omega_k - \omega_i + 2\omega_j)}{(\omega_i - \omega_j)(\omega_j + \omega_k)} + \frac{1}{4}H_{jki\ell}\frac{\omega_k(\omega_j - \omega_i + 2\omega_k)}{(\omega_i - \omega_k)(\omega_j + \omega_k)} + \frac{1}{4}H_{kij\ell}\frac{\omega_i(\omega_j + \omega_k - 2\omega_i)}{(\omega_i - \omega_j)(\omega_i - \omega_k)}$$

$$- \frac{1}{2}\omega_j\omega_k X_{ijk\ell}\left(\frac{\omega_k}{\omega_i - \omega_j} + \frac{\omega_j}{\omega_i - \omega_k} - 1\right) + \frac{1}{2}\omega_i\omega_k X_{jki\ell}\left(\frac{\omega_k}{\omega_i - \omega_j} + \frac{\omega_i}{\omega_j + \omega_k} - 1\right)$$

$$+ \frac{1}{2}\omega_i\omega_j X_{kij\ell}\left(\frac{\omega_j}{\omega_i - \omega_k} + \frac{\omega_i}{\omega_j + \omega_k} - 1\right) + \frac{m^2}{4}V_{jki\ell}\left(\frac{\omega_j}{\omega_i - \omega_j} + \frac{\omega_k}{\omega_i - \omega_k} - 1\right)$$

$$- \frac{m^2}{4}V_{kij\ell}\left(\frac{\omega_i}{\omega_i - \omega_j} + \frac{\omega_k}{\omega_j + \omega_k} + 1\right) - \frac{m^2}{4}V_{ijk\ell}\left(\frac{\omega_i}{\omega_i - \omega_k} + \frac{\omega_j}{\omega_j + \omega_k} + 1\right)$$

$$+ \frac{1}{4}Z^-_{kji\ell}\left(\frac{\omega_i}{\omega_j + \omega_k}\right) - \frac{1}{4}Z^+_{ijk\ell}\left(\frac{\omega_k}{\omega_i - \omega_j}\right) - \frac{1}{4}Z^+_{jki\ell}\left(\frac{\omega_j}{\omega_i - \omega_k}\right). \tag{3.8}$$

Building on the work done with massless scalars, we are able to demonstrate that (3.6) and (3.8) continue to vanish for massive scalars in the boundary gauge; thus, the weak turbulence is determined only from the remaining resonance channel. When non-normalizable modes are introduced, we will see that naturally vanishing resonances are not present.

PLOT OF Γ AND Ω FOR MASSIVE SCALARS?

3.2 $(+ + -)$

The first non-vanishing contributions arise when $\omega_i + \omega_j = \omega_k + \omega_\ell$. This contribution can be split into three coefficients that are evaluated for certain subsets of the allowed values for the indices, namely

$$S_\ell = T_\ell a_\ell^3 \cos(\theta_\ell + \theta_\ell - \theta_\ell) + \sum_{i \neq \ell}^{\infty} R_{i\ell}\, a_i^2 a_\ell \cos(\theta_i + \theta_\ell - \theta_i)$$

$$+ \sum_{i \neq \ell}^{\infty}\sum_{j \neq \ell}^{\infty} S_{ij(i+j-\ell)\ell}\, a_i a_j a_{(i+j-\ell)} \cos(\theta_i + \theta_j - \theta_{i+j-\ell}) + \ldots \tag{3.9}$$

where each of the coefficients is given by

$$S_{ijk\ell} = -\frac{1}{4}H_{kij\ell}\frac{\omega_i(\omega_j - \omega_k + 2\omega_i)}{(\omega_i - \omega_k)(\omega_i + \omega_j)} - \frac{1}{4}H_{ijk\ell}\frac{\omega_j(\omega_i - \omega_k + 2\omega_j)}{(\omega_j - \omega_k)(\omega_i + \omega_j)} - \frac{1}{4}H_{jki\ell}\frac{\omega_k(\omega_i + \omega_j - 2\omega_k)}{(\omega_i - \omega_k)(\omega_j - \omega_k)}$$

$$- \frac{1}{2}\omega_j\omega_k X_{ijk\ell}\left(\frac{\omega_j}{\omega_i - \omega_k} - \frac{\omega_k}{\omega_i + \omega_j} + 1\right) - \frac{1}{2}\omega_i\omega_k X_{jki\ell}\left(\frac{\omega_i}{\omega_j - \omega_k} - \frac{\omega_k}{\omega_i + \omega_j} + 1\right)$$

$$+ \frac{1}{2}\omega_i\omega_j X_{kij\ell}\left(\frac{\omega_i}{\omega_j - \omega_k} + \frac{\omega_j}{\omega_i - \omega_k} + 1\right) - \frac{m^2}{4}V_{ijk\ell}\left(\frac{\omega_i}{\omega_i - \omega_k} + \frac{\omega_j}{\omega_j - \omega_k} + 1\right)$$

$$+ \frac{m^2}{4}V_{jki\ell}\left(\frac{\omega_k}{\omega_i - \omega_k} - \frac{\omega_j}{\omega_i + \omega_j} - 1\right) + \frac{m^2}{4}V_{kij\ell}\left(\frac{\omega_k}{\omega_j - \omega_k} - \frac{\omega_i}{\omega_i + \omega_j} - 1\right)$$

$$+ \frac{1}{4}Z^-_{ijk\ell}\left(\frac{\omega_k}{\omega_i + \omega_j}\right) + \frac{1}{4}Z^+_{ikj\ell}\left(\frac{\omega_j}{\omega_i - \omega_k}\right) + \frac{1}{4}Z^+_{jki\ell}\left(\frac{\omega_i}{\omega_j - \omega_k}\right), \tag{3.10}$$

$$R_{i\ell} = \left(\frac{\omega_i^2}{\omega_\ell^2 - \omega_i^2}\right)\left(Y_{i\ell\ell i} - Y_{i\ell i\ell} + \omega_\ell^2(X_{i\ell i\ell} - X_{\ell i\ell i})\right) + \left(\frac{\omega_i^2}{\omega_\ell^2 - \omega_i^2}\right)\left(H_{\ell i i\ell} + m^2 V_{i i\ell\ell} - 2\omega_i^2 X_{\ell i i\ell}\right)$$

$$- \left(\frac{\omega_\ell^2}{\omega_\ell^2 - \omega_i^2}\right)\left(H_{i\ell i\ell} + m^2 V_{\ell i i\ell} - 2\omega_i^2 X_{i\ell i\ell}\right) - \frac{m^2}{4}(V_{i\ell i\ell} + V_{i i\ell\ell}) + \omega_i^2\omega_\ell^2(P_{i i\ell} - 2P_{\ell\ell i})$$

$$- \omega_i\omega_\ell X_{i\ell i\ell} - \frac{3m^2}{2}V_{\ell i i\ell} - \frac{1}{2}H_{i i\ell\ell} + \omega_\ell^2 B_{i i\ell} - \omega_i^2 M_{\ell\ell i} - m^2\omega_i^2 Q_{\ell\ell i}\,, \tag{3.11}$$

and

$$T_\ell = \frac{1}{2}\omega_\ell^2\left(X_{\ell\ell\ell\ell} + 4B_{\ell\ell\ell} - 2M_{\ell\ell\ell} - 2m^2 Q_{\ell\ell\ell}\right) - \frac{3}{4}\left(H_{\ell\ell\ell\ell} + 3m^2 V_{\ell\ell\ell\ell}\right)\,. \tag{3.12}$$

PLOT OF S, R, T FOR MASSIVE SCALARS?

4 Resonances From Non-normalizable Modes

Discuss falloff of A2 and delta2 with three NN modes, but don't calculate anything new. Mention overlap of NN and normalizable cases when omega(i) $\pm$ omega(j) $=$ NN frequency. Then focus on two NN modes.

We now consider the case when at least one of the $e_i(x), e_j(x), e_k(x)$ is a non-normalizable mode. Since the boundary condition has been set to be a single non-normalizable mode, any non-normalizable modes in the source term must exactly cancel; therefore, at least two of the modes must be non-normalizable. This assumption breaks some of the symmetries that contributed to the previous expressions for resonance channels, and so the resonance conditions must be re-examined starting from the source expression (2.13).

An important consideration is also the effect of non-normalizable modes on the perturbative expansion that leads to the source equations. Since non-normalizable solutions do not have well-defined norms, we do not know *a priori* that the inner products described in Appendix **??** are still finite. To investigate this, consider the second-order metric function A_2

$$A_2 = -\nu \int_0^x dy\,\mu\left((\dot{\phi}_1)^2 + (\phi_1')^2 + m^2\phi_1^2 \sec^2 x\right)\,, \tag{4.1}$$

in the limit of $x \to \pi/2$ when the scalar field is given by a generic superposition of normalizable and non-normalizable eigenfunctions:

$$\phi_1(t, x) = \sum_\alpha e_\alpha \cos(\omega_\alpha t) + \sum_i a_i e_i \cos(\omega_i t + b_i)\,. \tag{4.2}$$

Focusing on the position-dependence only, we find that

$$\lim_{\tilde{x}\to 0} A_2(\tilde{x} = \pi/2 - x) = \tilde{x}^{-\xi}\left(\frac{2\tilde{x}^{2+d}}{2-\xi} - \frac{\tilde{x}^d(1+(\Delta^-)^2)}{\xi}\right) \tag{4.3}$$

where we have defined $\xi = \sqrt{d^2 + 4m^2}$. In the massless case, $\xi = d$ and all powers of $\tilde{x}$ are non-negative and thus the limit is finite; for tachyonic masses, $0 \le \xi < d$ and the limit is again

finite. However, for massive scalars, at least one of the terms above diverges as $\xi \to 0$. This case would require the addition of counter-terms in the bulk action to cancel such divergences – we will not consider this case presently. Thus, we will restrict our discussion to $m^2 \leq 0$ to avoid these issues. A similar check on the near-boundary behaviour of δ_2 shows that, in the massless case, the gauge condition $\delta_2(t, x = \pi/2)$ remains unchanged by the addition of non-normalizable modes.

4.1 Two Non-normalizable Modes with Equal Frequencies

As a first case, let us assume that the two non-normalizable modes have equal, constant, and arbitrary frequencies, $\overline{\omega}$. Applying the time-averaging procedure to the source S_ℓ once again eliminates all contributions except those that satisfy (3.1). Since the basis onto which we are projecting is normalizable, we know that ω_ℓ is given by $\omega_\ell = 2\ell + \Delta^+$. We are now free to choose any one of $\{\omega_i, \omega_j, \omega_k\}$ to be normalizable and consider when the resonance condition is satisfied. In particular, we find that the following combinations are resonant:

$$\omega_i - \omega_j + \omega_k - \omega_\ell = 0 \qquad \Rightarrow \qquad \text{either } \omega_i \text{ or } \omega_k \text{ is normalizable} \tag{4.4}$$

$$\omega_i + \omega_j - \omega_k - \omega_\ell = 0 \qquad \Rightarrow \qquad \text{either } \omega_i \text{ or } \omega_j \text{ is normalizable} \tag{4.5}$$

$$\omega_i - \omega_j - \omega_k + \omega_\ell = 0 \qquad \Rightarrow \qquad \text{either } \omega_j \text{ or } \omega_k \text{ is normalizable.} \tag{4.6}$$

When any of these resonance conditions is met, the remaining normalizable mode will have a frequency equal to ω_ℓ, collapsing all sums over frequencies so that

$$S_\ell = \overline{T}_{\ell\overline{\omega}} \, a_\ell A_{\overline{\omega}}^2 \cos(\theta_\ell) \,, \tag{4.7}$$

where the non-normalizable modes have constant amplitudes $A_{\overline{\omega}}$. Collecting the appropriate terms in (2.13), and evaluating the each possible resonance (being careful not to violate restrictions placed on the sums), we find that

$$\overline{T}_{\ell\overline{\omega}} = \left[\frac{1}{2} Z_{\ell\overline{\omega}\omega\ell}^- \left(\frac{\overline{\omega}}{\omega_\ell + \overline{\omega}} \right) + \frac{1}{2} Z_{\ell\overline{\omega}\omega\ell}^+ \left(\frac{\overline{\omega}}{\omega_\ell - \overline{\omega}} \right) + H_{\ell\overline{\omega}\omega\ell} \left(\frac{\overline{\omega}^2}{\omega_\ell^2 - \overline{\omega}^2} \right) - H_{\overline{\omega}\ell\overline{\omega}\ell} \left(\frac{\omega_\ell^2}{\omega_\ell^2 - \overline{\omega}^2} \right) \right.$$
$$- m^2 V_{\ell\overline{\omega}\omega\ell} \left(\frac{\omega_\ell^2}{\omega_\ell^2 - \overline{\omega}^2} \right) + m^2 V_{\overline{\omega}\omega\ell\ell} \left(\frac{\overline{\omega}^2}{\omega_\ell^2 - \overline{\omega}^2} \right) + 2 X_{\overline{\omega}\omega\ell\ell} \left(\frac{\overline{\omega}^2\omega_\ell^2}{\omega_\ell^2 - \overline{\omega}^2} \right) - 2 X_{\ell\ell\overline{\omega}\omega} \left(\frac{\overline{\omega}^4}{\omega_\ell^2 - \overline{\omega}^2} \right) \left. \right]_{\overline{\omega} \neq \omega_\ell}$$
$$+ \omega_\ell^2 X_{\overline{\omega}\omega\ell\ell} - \overline{\omega}^2 X_{\ell\ell\overline{\omega}\omega} - \frac{3}{2} m^2 V_{\ell\ell\overline{\omega}\omega} - \frac{1}{2} m^2 V_{\overline{\omega}\omega\ell\ell} - \frac{1}{2} H_{\overline{\omega}\omega\ell\ell} + \omega_\ell^2 \tilde{Z}_{\overline{\omega}\omega\ell}^+ - 2\overline{\omega}^2 \omega_\ell^2 P_{\ell\ell\overline{\omega}}$$
$$- \overline{\omega}^2 \left(\omega_\ell^2 P_{\ell\ell\overline{\omega}} - B_{\ell\ell\overline{\omega}} \right) \,. \tag{4.8}$$

Notice that the terms in the square braces only contribute when $\overline{\omega} \neq \omega_\ell$. Beginning from (2.13), only terms in the square braces that are proportional to $Z^\pm$ are limited in this way; the remaining terms have no such restriction. However, it can be shown that integral functions with permuted indices are equal when the non-normalizable frequency equals the normalizable frequency. Upon simplification, factors of $\omega_\ell^2 - \overline{\omega}^2$ are canceled and the overall contribution to $T_{\overline{\omega}\ell}$ from the terms in the braces is zero. Thus, these terms are grouped with those that have natural restrictions on the indices.
Figure 1: *Left:* Evaluating S_ℓ (rescaled by the amplitudes) when $m^2 = 0$ for various choices of $\overline{\omega}$. *Right:* The behaviour of S_ℓ for $\overline{\omega}$ values near ω_0.

In figures 1 and 2, we evaluate (4.8) for $\ell < 10$ over a variety of $\overline{\omega}$ values first for a massless scalar, then for a tachyonic scalar.

Other resonant contributions become possible for more restrictive values of the non-normalizable frequency, such as if $\overline{\omega}$ is allow to be an integer. These contributions are not included here, but rather are discussed briefly in Appendix B.

4.2 Special Values of Non-normalizable Frequencies

Focus on non-arbitrary values of the non-normalizable frequencies.

4.2.1 Add to an integer

Choose two of the modes to be non-normalizable with frequencies $\overline{\omega}_1$ and $\overline{\omega}_2$ that add to give an integer: $\overline{\omega}_1 + \overline{\omega}_2 = 2n$ where $n = 1, 2, 3, \ldots$ (note that the $n = 0$ case means that both $\overline{\omega}_1$ and $\overline{\omega}_2$ would need to be zero by the positive-frequency requirement and so would not contribute). Furthermore, either frequency need not be an integer and therefore the difference $|\overline{\omega}_1 - \overline{\omega}_2|$ will, in general, not be an integer. In §4.3, we examine the case when the difference of non-normalizable frequencies is an integer.
Figure 2: *Left:* Evaluating $\overline{T}_{\ell\overline{\omega}}$ for a tachyon with $m^2 = -4.0$. *Right:* The behaviour of S_ℓ near $\omega_0 = \Delta^+ = 2$.

When we consider possible resonance channels, we see that resonances can be grouped into

$$(++): \; \omega_I + 2n = \omega_\ell \quad I \in \{i,j,k\} \; \forall \; \ell \geq n \tag{4.9}$$

$$(+-): \; \omega_I - 2n = \omega_\ell \quad I \in \{i,j,k\} \; \forall \; n \tag{4.10}$$

for any $m_{BF}^2 \leq m^2 < 0$. However, for a massless scalar, we have an additional channel

$$(-+): \; -\omega_I + 2n = \omega_\ell \quad I \in \{i,j,k\} \; \forall \; n \geq \ell + d \tag{4.11}$$

Adding the channels together, the total source term is

$$S_\ell = \Theta\left(\ell - n\right) \overline{R}^{(++)}_{(\ell-n)12\ell} \cos\left(\theta_{(\ell-n)} + 2nt\right) + \overline{R}^{(+-)}_{(\ell+n)12\ell} \cos\left(\theta_{(\ell+n)} - 2nt\right)$$

$$+ \left[\Theta\left(n - \ell - d\right) \overline{R}^{(-+)}_{(n-\ell-d)12\ell} \cos\left(\theta_{(n-\ell-d)} + 2nt\right)\right]_{m^2=0} + \overline{T}_{12\ell} \cos\left(\theta_\ell\right), \tag{4.12}$$

where the Heaviside step function $\Theta(x)$ enforces the restrictions on the indices in (4.9) and (4.11).

In the following expressions, the sum over all $\overline{\omega}_1$, $\overline{\omega}_2$ such that $\overline{\omega}_1 + \overline{\omega}_2 = 2n$ is implied, and only the restrictions on individual frequencies are included. Examining each channel in

([4.12](#)) individually, we find that

$$\overline{R}_{i12\ell}^{(++)} = -\frac{1}{4} \sum_{\overline{\omega}_2 \neq \omega_\ell} \frac{\overline{\omega}_2}{\omega_\ell - \overline{\omega}_2} Z_{i12\ell}^- - \frac{1}{4} \sum_{\overline{\omega}_1 \neq \omega_\ell} \frac{\overline{\omega}_1}{\omega_\ell - \overline{\omega}_1} Z_{i21\ell}^- - \frac{1}{8n} \sum (\omega_\ell - 2n) \, Z_{12i\ell}^-$$

$$- \frac{1}{4} \sum_{\omega_i \neq \overline{\omega}_1} \frac{1}{\omega_\ell - \overline{\omega}_2} \left[\overline{\omega}_1 \left(H_{i12\ell} + m^2 V_{12i\ell} - 2\overline{\omega}_2^2 X_{i12\ell} \right) + (\omega_\ell - 2n) \left(H_{1i2\ell} + m^2 V_{i21\ell} - 2\overline{\omega}_2^2 X_{1i2\ell} \right) \right]$$

$$- \frac{1}{4} \sum_{\omega_i \neq \overline{\omega}_2} \frac{1}{\omega_\ell - \overline{\omega}_1} \left[\overline{\omega}_2 \left(H_{i21\ell} + m^2 V_{21i\ell} - 2\overline{\omega}_1^2 X_{i21\ell} \right) + (\omega_\ell - 2n) \left(H_{2i1\ell} + m^2 V_{i12\ell} - 2\overline{\omega}_1^2 X_{2i1\ell} \right) \right]$$

$$- \frac{1}{8n} \sum_{\overline{\omega}_1 \neq \overline{\omega}_2} \left[\overline{\omega}_1 H_{21i\ell} + \overline{\omega}_2 H_{12i\ell} + m^2 \left(\overline{\omega}_1 V_{1i2\ell} + \overline{\omega}_2 V_{2i1\ell} \right) - (\omega_\ell - 2n)^2 \left(\overline{\omega}_1 X_{21i\ell} + \overline{\omega}_2 X_{12i\ell} \right) \right]$$

$$+ \frac{1}{2} \sum \left[\overline{\omega}_1 \overline{\omega}_2 X_{i12\ell} + (\omega_\ell - 2n) \left(\overline{\omega}_1 X_{21i\ell} + \overline{\omega}_2 X_{12i\ell} \right) - \frac{m^2}{2} \left(V_{i12\ell} + V_{i21\ell} + V_{12i\ell} \right) \right] \tag{4.13}$$

The notation $X_{i12\ell}$ corresponds to evaluating $X_{ijk\ell}$ with $\omega_j = \overline{\omega}_1$ and $\omega_k = \overline{\omega}_2$.

Next, we find that

$$\overline{R}_{i12\ell}^{(+-)} = -\frac{1}{4} \sum \left[\frac{(\omega_\ell + 2n)}{2n} Z_{12i\ell}^- + 2(\omega_\ell + 2n) \left(\overline{\omega}_1 X_{21i\ell} + \overline{\omega}_2 X_{12i\ell} \right) \right.$$

$$- \frac{\overline{\omega}_1}{(\omega_\ell + \overline{\omega}_2)} \left(H_{i12\ell} + m^2 V_{12i\ell} - 2\overline{\omega}_2^2 X_{i12\ell} \right) + \frac{(\omega_\ell + 2n)}{(\omega_\ell + \overline{\omega}_2)} \left(H_{1i2\ell} + m^2 V_{i21\ell} - 2\overline{\omega}_2^2 X_{1i2\ell} \right)$$

$$- \frac{\overline{\omega}_2}{(\omega_\ell + \overline{\omega}_1)} \left(H_{i21\ell} + m^2 V_{21i\ell} - 2\overline{\omega}_1^2 X_{i21\ell} \right) + \frac{(\omega_\ell + 2n)}{(\omega_\ell + \overline{\omega}_1)} \left(H_{2i1\ell} + m^2 V_{i12\ell} - 2\overline{\omega}_1^2 X_{2i1\ell} \right)$$

$$\left. - 2\overline{\omega}_1 \overline{\omega}_2 X_{i12\ell} + m^2 \left(V_{12i\ell} + V_{i12\ell} + V_{i21\ell} \right) \right] + \frac{1}{4} \sum_{\overline{\omega}_2 \neq \omega_\ell} \frac{\overline{\omega}_1 \overline{\omega}_2 (\omega_\ell + 2n)}{\omega_\ell + \overline{\omega}_2} \left(X_{21i\ell} - X_{\ell i 12} \right)$$

$$+ \frac{1}{4} \sum_{\overline{\omega}_1 \neq \omega_\ell} \frac{\overline{\omega}_1 \overline{\omega}_2 (\omega_\ell + 2n)}{\omega_\ell + \overline{\omega}_1} \left(X_{12i\ell} - X_{\ell i 12} \right). \tag{4.14}$$

When $m^2 = 0$, we have contributions from

$$\overline{R}_{i12\ell}^{(-+)} = \frac{1}{4} \sum_{\overline{\omega}_2 \neq \omega_\ell} \frac{\overline{\omega}_2}{\omega_\ell - \overline{\omega}_2} Z_{i12\ell}^+ + \frac{1}{4} \sum_{\overline{\omega}_1 \neq \omega_\ell} \frac{\overline{\omega}_1}{\omega_\ell - \overline{\omega}_1} Z_{i21\ell}^+ + \frac{1}{4} \sum_{i \neq \ell} \left(\frac{2n - \omega_\ell}{2n} \right) Z_{12i\ell}^-$$

$$+ \frac{1}{4} \sum_{\overline{\omega}_1 \neq \omega_i} \frac{1}{\omega_i - \overline{\omega}_1} \left[\overline{\omega}_1 \left(H_{i12\ell} - 2\overline{\omega}_2^2 X_{i12\ell} \right) - (2n - \omega_\ell) \left(H_{1i2\ell} - 2\overline{\omega}_2^2 X_{1i2\ell} \right) \right]$$

$$+ \frac{1}{4} \sum_{\overline{\omega}_2 \neq \omega_i} \frac{1}{\omega_i - \overline{\omega}_2} \left[\overline{\omega}_2 \left(H_{i21\ell} - 2\overline{\omega}_1^2 X_{i21\ell} \right) - (2n - \omega_\ell) \left(H_{2i1\ell} - 2\overline{\omega}_1^2 X_{2i1\ell} \right) \right]$$

$$- \frac{1}{8n} \sum_{\overline{\omega}_1 \neq \overline{\omega}_2} \left[\overline{\omega}_1 H_{21i\ell} + \overline{\omega}_2 H_{12i\ell} - 2 \left(2n - \omega_\ell \right)^2 \left(\overline{\omega}_1 X_{21i\ell} + \overline{\omega}_2 X_{12i\ell} \right) \right]$$

$$- \frac{1}{2} \sum \left[(2n - \omega_\ell) \left(\overline{\omega}_1 X_{21i\ell} + \overline{\omega}_2 X_{12i\ell} \right) - \overline{\omega}_1 \overline{\omega}_2 X_{i12\ell} \right]. \tag{4.15}$$
Figure 3: *Left*: Source term values for a tachyonic scalar with $m^2 = -4.0$ when the frequencies of non-normalizable modes sum to 4.0. *Right*: The absolute value of the sum of the source terms for each choice of $\overline{\omega}_1$, $\overline{\omega}_2$.

NB. In (4.15) *only*, $\omega_i = 2i + \Delta^+ = 2i + d$ since this term requires that $m^2 = 0$ to contribute. We maintain the same notation out of convenience, despite the special case.

Finally,

$$\overline{T}_{12\ell} = \frac{1}{2}\omega_\ell^2 \left(\tilde{Z}_{11\ell}^+ + \tilde{Z}_{22\ell}^+ \right) - \frac{1}{2}\Big[H_{11\ell\ell} + H_{22\ell\ell} + m^2 \left(V_{\ell 11\ell} + V_{\ell 22\ell} \right) - 2\omega_\ell^2 \left(X_{11\ell\ell} + X_{22\ell\ell} \right)$$
$$+ 4\omega_\ell^2 \left(\overline{\omega}_1^2 P_{\ell\ell 1} + \overline{\omega}_2^2 P_{\ell\ell 2} \right) + 2\overline{\omega}_1^2 M_{\ell\ell 1} + 2\overline{\omega}_2^2 M_{\ell\ell 2} + 2m^2 \left(\overline{\omega}_1^2 Q_{\ell\ell 1} + \overline{\omega}_2^2 Q_{\ell\ell 2} \right) \Big]. \quad (4.16)$$

To examine the effect of the choice of n on the value of S_ℓ and $|\Sigma S_\ell|$, figure 4 provides a comparison between the value of the source term for a massless scalar for two choices of n.

4.3 Integer Plus χ

This is a case where the non-normalizable frequencies are non-integer, but differ from integer values by a specific amount. In analogue to the case where all modes are normalizable, we consider setting any two of the non-normalizable frequencies to

$$\omega_\gamma = 2\gamma + \chi, \quad (4.17)$$

Figure 4: *Above:* The value of (4.12) as a function of ℓ for a massless scalar with values of $\overline{\omega}_1$ and $\overline{\omega}_2$ chosen so that $\overline{\omega}_1 + \overline{\omega}_2 = 4$. *Below:* The same plot but with values chosen to satisfy $\overline{\omega}_1 + \overline{\omega}_2 = 8$.

where m^2 is *not* chosen to be a special value[1], i.e. $\chi \notin \mathbb{Z}^*$, and γ is an integer (greek letters are chosen to differentiate between normalizable modes with integer frequencies that use roman letters). For this choice of non-normalizable frequencies, there are no resonant contributions from the all-plus channel; only when either $\omega_i + \omega_\gamma = \omega_\beta - \omega_\ell$, or $\omega_i + \omega_\gamma = \omega_\beta + \omega_\ell$ with

---

[1]By tuning the value of the mass so that χ is an integer, additional resonant terms are possible; however, this scenario is addressed in §4.2.1. Furthermore, we do not consider the case when the Breitenlohmer-Freeman bound is saturated. This would place further restrictions on the allowed values of the indices in certain terms since the difference between the frequencies of normalizable and non-normalizable modes could then be zero.

$i + \gamma \geq \ell$, are resonant terms present.

4.3.1 $\quad \omega_i + \omega_\gamma = \omega_\beta - \omega_\ell$

This channel contributes secular terms of the form

$$S_\ell = \sum_{i \neq \ell} \sum_{\gamma \neq \beta} \overline{S}_{i(i+\gamma+\ell)\gamma\ell} \cos\left(\theta_i - \theta_{(i+\gamma+\ell)} + \theta_\gamma\right) + \sum_\beta \overline{R}_{\beta\ell} \cos\left(\theta_\ell + \theta_\beta - \theta_\beta\right) \qquad (4.18)$$

where

$$\overline{S}_{i\beta\gamma\ell} = \frac{1}{4} H_{\beta\gamma i\ell} \frac{\omega_\gamma(\omega_i - \omega_\beta + 2\omega_\gamma)}{(\omega_\beta - \omega_\gamma)(\omega_i + \omega_\gamma)} - \frac{1}{4} H_{\gamma\beta i\ell} \frac{\omega_\beta(\omega_i + \omega_\gamma - 2\omega_\beta)}{(\omega_i - \omega_\beta)(\omega_\beta - \omega_\gamma)} - \frac{1}{4} H_{\gamma i\beta\ell} \frac{\omega_i(\omega_\gamma - \omega_\beta + 2\omega_i)}{(\omega_i - \omega_\beta)(\omega_i + \omega_\gamma)}$$

$$+ \frac{1}{2} \omega_i \omega_\gamma X_{\beta\gamma i\ell} \left(\frac{\omega_\gamma}{\omega_i - \omega_\beta} - \frac{\omega_i}{\omega_\beta + \omega_\gamma} + 1 \right) + \frac{1}{2} \omega_i \omega_\beta X_{\gamma\beta i\ell} \left(\frac{\omega_i}{\omega_\beta - \omega_\gamma} + \frac{\omega_\beta}{\omega_i + \omega_\gamma} - 1 \right)$$

$$+ \frac{1}{2} \omega_\beta \omega_\gamma X_{i\beta\gamma\ell} \left(\frac{\omega_\beta}{\omega_i + \omega_\gamma} - \frac{\omega_\gamma}{\omega_i - \omega_\beta} - 1 \right) - \frac{1}{4} Z^+_{\beta\gamma i\ell} \left(\frac{\omega_i}{\omega_i + \omega_\ell} \right)$$

$$+ \frac{1}{4} Z^-_{i\gamma\beta\ell} \left(\frac{\omega_\beta}{\omega_\ell - \omega_\beta} \right) + \frac{1}{4} Z^+_{i\beta\gamma\ell} \left(\frac{\omega_\gamma}{\omega_\ell + \omega_\gamma} \right) \qquad (4.19)$$

and

$$\overline{R}_{\beta\ell} = \frac{1}{4} Z^-_{\ell\beta\beta\ell} \left(\frac{\omega_\beta}{\omega_\ell + \omega_\beta} \right) + \frac{1}{4} Z^+_{\ell\beta\beta\ell} \left(\frac{\omega_\beta}{\omega_\ell - \omega_\beta} \right) + \frac{1}{2} H_{\ell\beta\beta\ell} \left(\frac{\omega_\beta^2}{\omega_\ell^2 - \omega_\beta^2} \right) - \frac{1}{2} H_{\beta\ell\beta\ell} \left(\frac{\omega_\ell^2}{\omega_\ell^2 - \omega_\beta^2} \right)$$

$$+ X_{\beta\ell\beta\ell} \left(\frac{\omega_\ell^4}{\omega_\ell^2 - \omega_\beta^2} \right) - \frac{1}{2} \omega_\beta^2 X_{\ell\beta\beta\ell} \left(\frac{\omega_\ell^2 + \omega_\beta^2}{\omega_\ell^2 - \omega_\beta^2} \right) - \frac{1}{2} H_{\ell\beta\beta\ell} + \omega_\ell^2 \tilde{Z}^+_{\beta\beta\ell} - 2\omega_\beta^2 \omega_\ell^2 P_{\ell\ell\beta} - \omega_\beta^2 M_{\ell\ell\beta} \qquad (4.20)$$

4.3.2 $\quad \omega_i + \omega_\gamma = \omega_\beta + \omega_\ell$

This channel contributes secular terms of the form

$$S_\ell = \underbrace{\sum_{i \neq \ell} \sum_{\gamma \neq \beta}}_{i+\gamma \geq \ell} \overline{S}_{i(i+\gamma-\ell)\gamma\ell} \cos\left(\theta_i - \theta_{(i+\gamma-\ell)} + \theta_\gamma\right) + \sum_\beta \overline{R}_{\beta\ell} \cos\left(\theta_\ell + \theta_\beta - \theta_\beta\right) \qquad (4.21)$$

where

$$\overline{S}_{i\beta\gamma\ell} = \frac{1}{4} H_{\beta\gamma i\ell} \frac{\omega_\gamma(\omega_i - \omega_\beta)}{(\omega_\beta - \omega_\gamma)(\omega_i - \omega_\gamma)} - \frac{1}{4} H_{\gamma\beta i\ell} \frac{\omega_\beta(\omega_\ell - \omega_\beta)}{(\omega_\beta - \omega_\gamma)(\omega_i - \omega_\beta)} + \frac{1}{4} H_{\beta i\gamma\ell} \frac{\omega_i(\omega_\gamma - \omega_\beta)}{(\omega_i - \omega_\beta)(\omega_i - \omega_\gamma)}$$

$$+ \frac{1}{2} \omega_i \omega_\gamma X_{\beta\gamma i\ell} \left(\frac{\omega_\gamma}{\omega_i - \omega_\beta} - \frac{\omega_i}{\omega_\beta - \omega_\gamma} + 1 \right) + \frac{1}{2} \omega_i \omega_\beta X_{\gamma\beta i\ell} \left(\frac{\omega_i}{\omega_\beta - \omega_\gamma} - \frac{\omega_\beta}{\omega_i - \omega_\gamma} - 1 \right)$$

$$+ \frac{1}{2} \omega_\beta \omega_\gamma X_{i\beta\gamma\ell} \left(\frac{\omega_\beta}{\omega_i - \omega_\gamma} - \frac{\omega_\gamma}{\omega_i - \omega_\beta} - 1 \right) + \frac{1}{4} Z^-_{i\gamma\beta\ell} \left(\frac{\omega_\beta}{\omega_\ell + \omega_\beta} \right)$$

$$+ \frac{1}{4} Z^+_{i\beta\gamma\ell} \left(\frac{\omega_\gamma}{\omega_\ell - \omega_\gamma} \right) - \frac{1}{4} Z^+_{\beta\gamma i\ell} \left(\frac{\omega_i}{\omega_i - \omega_\ell} \right) \qquad (4.22)$$
Figure 5: *Left:* Evaluating the source term (4.18) for various values of χ for $\ell < 10$. *Right:* Evaluating the source term (4.21) subject to $i + \gamma \geq \ell$ for the same values of χ and the same range of ℓ.

and

$$\overline{R}_{\beta\ell} = \frac{1}{4} Z^-_{\ell\beta\beta\ell} \left(\frac{\omega_\beta}{\omega_\ell + \omega_\beta} \right) + \frac{1}{4} Z^+_{\ell\beta\beta\ell} \left(\frac{\omega_\beta}{\omega_\ell - \omega_\beta} \right) + \frac{1}{2} H_{\ell\beta\beta\ell} \left(\frac{\omega_\beta^2}{\omega_\ell^2 - \omega_\beta^2} \right) - \frac{1}{2} H_{\beta\ell\beta\ell} \left(\frac{\omega_\ell^2}{\omega_\ell^2 - \omega_\beta^2} \right)$$
$$+ X_{\beta\beta\ell\ell} \left(\frac{\omega_\ell^2}{\omega_\ell^2 - \omega_\beta^2} \right) + \frac{1}{2} \omega_\beta^2 X_{\ell\beta\beta\ell} \left(\frac{\omega_\ell^2 + \omega_\beta^2}{\omega_\ell^2 - \omega_\beta^2} \right) - \frac{1}{2} H_{\beta\beta\ell\ell} + \omega_\ell^2 \tilde{Z}^+_{\beta\beta\ell} - 2\omega_\beta^2 \omega_\ell^2 P_{\ell\ell\beta} - \omega_\beta^2 M_{\ell\ell\beta} \tag{4.23}$$

In figure 5, we evaluate both resonance channels and plot their contributions for various values of χ. In particular, we examine values $\chi \in \{\pi/6, \ldots, 7\pi/6\}$.

5 Discussion

A Derivation of Source Terms For Massive Scalars

The backreaction between the metric and the scalar field appears at second order in the perturbation,

$$A_2' = -\mu\nu \left[(\dot{\phi}_1)^2 + (\phi_1')^2 + m^2\phi_1^2 \sec^2 x \right] + \nu' A_2/\nu \tag{A.1}$$

which can be directly integrated to give

$$A_2 = -\nu \int_0^x dy\, \mu \left((\dot{\phi}_1)^2 + (\phi_1')^2 + m^2 \phi_1^2 \sec^2 x \right) . \tag{A.2}$$

Furthermore, the first non-trivial contribution to the lapse in the boundary time gauge is

$$\delta_2 = \int_x^{\pi/2} dy\, \mu\nu \left((\dot{\phi}_1)^2 + (\phi_1')^2 \right) . \tag{A.3}$$

For convenience, we have also defined the functions

$$\mu(x) = (\tan x)^{d-1} \quad \text{and} \quad \nu(x) = (d-1)/\mu' . \tag{A.4}$$

To aide in evaluating integrals, we first derive the following identities: from the equation for the first-order time-dependent coefficients c_i,

$$\ddot{c}_i + \omega_i^2 c_i = 0 \quad \Rightarrow \quad \partial_t \left(\dot{c}_i^2 + \omega_i^2 c_i^2 \right) = \partial_t \mathbb{C}_i = 0 ; \tag{A.5}$$

from the equation definition of $\hat{L}$,

$$\hat{L} e_j = -\frac{1}{\mu} \left(\mu e_j' \right)' + m^2 \sec^2 x e_j \quad \Rightarrow \quad \left(\mu e_j' \right)' = \mu \left(m^2 \sec^2 x - \omega_j^2 \right) e_j ; \tag{A.6}$$

from considering the expression $(\mu e_i' e_j)'$:

$$\left(\mu e_i' e_j \right)' = \left(m^2 \sec^2 x - \omega_i^2 \right) \mu e_i e_j + \mu e_i' e_j' ; \tag{A.7}$$

from permuting i, j above and subtracting to give

$$\frac{\left[\mu(e_i' e_j \omega_j^2 - e_i e_j' \omega_i^2) \right]'}{(\omega_j^2 - \omega_i^2)} = \mu m^2 \sec^2 x e_i e_j + \mu e_i' e_j' . \tag{A.8}$$

The derivation of the source terms for massive scalars closely follows the massless case, particularly if one chooses not to write out the explicit mass dependence as was done in [1]. However, since we have chosen to write our equations in a slightly different way – and in a different gauge – than previous authors, one may find it instructive to see the differences in the derivations. Below we have included the intermediate steps involved in deriving the third-order source term S_ℓ.

Projecting each of the terms individually onto the eigenbasis $\{e_\ell\}$:

$$\langle \delta_2 \ddot{\phi}_1, e_\ell \rangle = -\sum_{i=0}^{\infty} \sum_{\substack{j=0 \\ k \neq \ell}}^{\infty} \sum_{k=0}^{\infty} \frac{\omega_k^2 c_k}{\omega_\ell^2 - \omega_k^2} \left[\dot{c}_i \dot{c}_j \left(X_{k\ell i j} - X_{\ell k i j} \right) + c_i c_j \left(Y_{i j \ell k} - Y_{i j k \ell} \right) \right]$$

$$- \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} \omega_\ell^2 c_\ell \left[\dot{c}_i \dot{c}_j P_{i j \ell} + c_i c_j B_{i j \ell} \right] , \tag{A.9}$$

$$\langle A_2 \ddot{\phi}_1, e_\ell \rangle = 2 \sum_{i=0}^{\infty} \sum_{\substack{j=0 \\ i \neq j}}^{\infty} \sum_{k=0}^{\infty} \frac{\omega_k^2 c_k}{\omega_j^2 - \omega_i^2} X_{i j k \ell} \left(\dot{c}_i \dot{c}_j + \omega_j^2 c_i c_j \right)$$

$$+ \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} \omega_j^2 c_j \left(\mathbb{C}_i P_{j \ell i} + c_i^2 X_{i i j \ell} \right) , \tag{A.10}$$

$$\langle \dot{\delta}_2 \dot{\phi}_1, e_\ell \rangle = \sum_{i=0}^{\infty} \sum_{\substack{j=0 \\ k \neq \ell}}^{\infty} \sum_{k=0}^{\infty} \frac{\dot{c}_k}{\omega_\ell^2 - \omega_k^2} \left[\partial_t \left(\dot{c}_i \dot{c}_j \right) \left(X_{k \ell i j} - X_{\ell k i j} \right) + \partial_t (c_i c_j) \left(Y_{i j \ell k} - Y_{i j k \ell} \right) \right]$$

$$+ \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} \dot{c}_\ell \left[\partial_t \left(\dot{c}_i \dot{c}_j \right) P_{i j \ell} + \partial_t (c_i c_j) B_{i j \ell} \right] , \tag{A.11}$$

$$\langle \dot{A}_2 \dot{\phi}_1, e_\ell \rangle = -2 \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} \sum_{k=0}^{\infty} \dot{c}_k \dot{c}_j c_i X_{i j k \ell} , \tag{A.12}$$

$$\langle \left(A_2' - \delta_2' \right) \phi_1', e_\ell \rangle = -2 \sum_{i=0}^{\infty} \sum_{\substack{j=0 \\ i \neq j}}^{\infty} \sum_{k=0}^{\infty} \frac{c_k (\dot{c}_i \dot{c}_j + \omega_j^2 c_i c_j)}{\omega_j^2 - \omega_i^2} H_{i j k \ell} - m^2 \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} \sum_{k=0}^{\infty} c_i c_j c_k V_{i j k \ell}$$

$$- \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} c_j \left[c_i^2 H_{i i j \ell} + \mathbb{C}_i M_{j \ell i} \right] , \tag{A.13}$$

$$\langle A_2 \phi_1 \sec^2 x, e_\ell \rangle = -2 \sum_{i=0}^{\infty} \sum_{\substack{j=0 \\ i \neq j}}^{\infty} \sum_{k=0}^{\infty} \frac{c_k (\dot{c}_i \dot{c}_j + \omega_j^2 c_i c_j)}{\omega_j^2 - \omega_i^2} V_{j k i \ell}$$

$$- \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} c_j \left(c_i^2 V_{j i i \ell} + \mathbb{C}_i Q_{j \ell i} \right) . \tag{A.14}$$

Where the forms of X, Y, V, H, B, M, P, and Q are given by

$$X_{ijk\ell} = \int_0^{\pi/2} dx\, \mu^2 \nu e_i' e_j e_k e_\ell \tag{A.15}$$

$$Y_{ijk\ell} = \int_0^{\pi/2} dx\, \mu^2 \nu e_i' e_j' e_k e_\ell' \tag{A.16}$$

$$V_{ijk\ell} = \int_0^{\pi/2} dx\, \mu^2 \nu e_i e_j e_k' e_\ell \sec^2 x \tag{A.17}$$

$$H_{ijk\ell} = \int_0^{\pi/2} dx\, \mu^2 \nu' e_i' e_j e_k' e_\ell \tag{A.18}$$

$$B_{ij\ell} = \int_0^{\pi/2} dx\, \mu\nu e_i' e_j' \int_0^x dy\, \mu e_\ell^2 \tag{A.19}$$

$$M_{ij\ell} = \int_0^{\pi/2} dx\, \mu\nu' e_i' e_j \int_o^x dy\, \mu e_\ell^2 \tag{A.20}$$

$$P_{ij\ell} = \int_0^{\pi/2} dx\, \mu\nu e_i e_j \int_0^x dy\, \mu e_\ell^2 \tag{A.21}$$

$$Q_{ij\ell} = \int_0^{\pi/2} dx\, \mu\nu e_i e_j \sec^2 x \int_0^x dy\, \mu e_\ell^2 \tag{A.22}$$

Collecting terms together gives the expression for $S_\ell = \langle S, e_\ell \rangle$:

$$
\begin{aligned}
S_\ell = &\sum_{\substack{i,j,k \\ k \neq \ell}}^\infty \frac{1}{\omega_\ell^2 - \omega_k^2} \left[F_k(\dot{c}_i \dot{c}_j) \left(X_{k\ell ij} - X_{\ell kij} \right) + F_k(c_i c_j) \left(Y_{ij\ell k} - Y_{ijk\ell} \right) \right] \\
&+ 2 \sum_{\substack{i,j,k \\ i \neq j}}^\infty \frac{c_k D_{ij}}{\omega_j^2 - \omega_i^2} \left[2\omega_k^2 X_{ijk\ell} - H_{ijk\ell} - m^2 V_{jki\ell} \right] - \sum_{i,j,k}^\infty c_i \left[2\dot{c}_j \dot{c}_k X_{ijk\ell} + m^2 c_j c_k V_{ijk\ell} \right] \\
&+ \sum_{i,j}^\infty \left[F_\ell(\dot{c}_i \dot{c}_j) P_{ij\ell} + F_\ell(c_i c_j) B_{ij\ell} + 2\omega_j^2 c_j \left(c_i^2 X_{iij\ell} + \mathbb{C}_i P_{j\ell i} \right) \right. \\
&\left. - c_j \left(c_i^2 (H_{iij\ell} + m^2 V_{jii\ell}) + \mathbb{C}_i (M_{j\ell i} + m^2 Q_{j\ell i}) \right) \right],
\end{aligned} \tag{A.23}
$$

where $F_k(z) = \dot{c}_k \dot{z} - 2\omega_k^2 c_k z$, $D_{ij} = \dot{c}_i \dot{c}_j + \omega_j^2 c_i c_j$, and $\mathbb{C}_i = \dot{c}_i^2 + \omega_i^2 c_i^2$.

To simplify the above expression, we have defined

$$Z_{ijk\ell}^\pm = \omega_i \omega_j \left(X_{k\ell ij} - X_{\ell kij} \right) \pm \left(Y_{ij\ell k} - Y_{ijk\ell} \right) \quad \text{and} \quad \tilde{Z}_{ij\ell}^\pm = \omega_i \omega_j P_{ij\ell} \pm B_{ij\ell}. \tag{A.24}$$

Using integration by parts to remove the derivative from ν in the definitions of $H_{ijk\ell}$ and $M_{ij\ell}$, we can show that

$$H_{ijk\ell} = \omega_i^2 X_{kij\ell} + \omega_k^2 X_{ijk\ell} - Y_{ij\ell k} - Y_{\ell kji} - m^2 V_{kji\ell} - m^2 V_{ijk\ell} \tag{A.25}$$

$$M_{ij\ell} = \omega_i^2 P_{ij\ell} - B_{ij\ell} - m^2 Q_{ij\ell} \tag{A.26}$$

B Two Non-normalizable Modes with Equal Frequencies

Consider activating two non-normalizable modes at the same general frequency, $\overline{\omega}$. In such a case, any two of the summed indices may represent a non-normalizable frequency. These non-normalizable modes may have frequencies that happen to satisfy $\overline{\omega} = \omega_\ell$ numerically; this does not change the fact that their basis functions are given by (2.11). With this is mind, the same time averaging procedure restricts the presence of resonant contributions to those that satisfy (3.1). Since the basis onto which we are projecting is normalizable, we know that $\omega_\ell = 2\ell + \Delta^+$, which means there are four cases in which resonance may occur.

In addition to the case of arbitrary values of $\overline{\omega}$, which is discussed in §4.1, the following resonances contribute to the source term S_ℓ via

$$S_\ell = a_\ell A_{\overline{\omega}}^2 \left(\overline{R}_{\ell\overline{\omega}}^{(1)} \cos\left(\theta_\ell - 2\overline{\omega}t\right) + \overline{R}_{\ell\overline{\omega}}^{(2)} \cos\left(\theta_\ell + 2\overline{\omega}t\right) + \overline{R}_{\ell\overline{\omega}}^{(3)} \cos\left(2\overline{\omega}t - \theta_\ell\right) \right) \tag{B.1}$$

under their respective conditions on the value of $\overline{\omega}$:

$$\overline{R}_{\ell\overline{\omega}}^{(1)}: \quad \omega_I = \omega_\ell + 2\overline{\omega} \quad I \in \{i, j, k\} \ \forall\, \overline{\omega} \in \mathbb{Z}^* \tag{B.2}$$

$$\overline{R}_{\ell\overline{\omega}}^{(2)}: \quad \omega_I = \omega_\ell - 2\overline{\omega} \quad I \in \{i, j, k\} \ \forall\, \overline{\omega} \in \mathbb{Z}^* \text{ such that } \ell \geq \overline{\omega} \tag{B.3}$$

$$\overline{R}_{\ell\overline{\omega}}^{(3)}: \quad \omega_I = 2\overline{\omega} - \omega_\ell \quad I \in \{i, j, k\} \ \forall\, \overline{\omega} \in \mathbb{Z}^* \text{ such that } \ell \leq \overline{\omega} \tag{B.4}$$

When $\overline{\omega} \in \mathbb{Z}^* \leq \ell$, resonance is at $\omega_i = \omega_\ell - 2\overline{\omega}$ with

$$
\begin{aligned}
\overline{R}_{i\overline{\omega}}^{(2)} = {}&-\frac{1}{12}\left(1 - \delta(\omega_\ell - \overline{\omega})\right) Z_{i\overline{\omega}\overline{\omega}\ell}^- \left(\frac{\overline{\omega}}{\omega_\ell - \overline{\omega}}\right) \\
&-\frac{1}{12}(1 - \delta(\omega_i - \overline{\omega}))\Big\{ \left(\frac{\overline{\omega}}{\omega_i + \overline{\omega}}\right)\left(H_{i\overline{\omega}\overline{\omega}\ell} + m^2 V_{\overline{\omega}\overline{\omega}i\ell} - 2\overline{\omega}^2 X_{i\overline{\omega}\overline{\omega}\ell}\right) + \\
&+ \left(\frac{\omega_\ell - 2\overline{\omega}}{\omega_i + \overline{\omega}}\right)\left(H_{\overline{\omega}i\overline{\omega}\ell} + m^2 V_{i\overline{\omega}\overline{\omega}\ell} - 2\overline{\omega}^2 X_{\overline{\omega}i\overline{\omega}\ell}\right)\Big] \\
&-\frac{(\omega_\ell - 2\overline{\omega})}{48\overline{\omega}} Z_{\overline{\omega}\overline{\omega}i\ell}^- + \frac{1}{12}\overline{\omega}^2 X_{i\overline{\omega}\overline{\omega}\ell} + \frac{\overline{\omega}(\omega_\ell - 2\overline{\omega})}{12} X_{\overline{\omega}\overline{\omega}i\ell} - \frac{m^2}{12} V_{i\overline{\omega}\overline{\omega}\ell} - \frac{m^2}{24} V_{\overline{\omega}\overline{\omega}i\ell}. \tag{B.5}
\end{aligned}
$$

When $\overline{\omega} \in \mathbb{Z}^*$ and $\overline{\omega} \geq \overline{\omega}$:

$$\overline{R}_{i\overline{\omega}}^{(2)} = \ . \tag{B.6}$$

When $\overline{\omega} \in \mathbb{Z}^*$ and $\overline{\omega} \leq \overline{\omega}$:

$$\overline{R}_{i\overline{\omega}}^{(3)} = \ . \tag{B.7}$$
